

PILOT TESTERS WANTED

Every new page has an **old friend**.

SELAR is a PDF reader we are building at UCSC. While you read, it suggests a possible link to something you read earlier, shows you both passages, and asks you to explain and decide.

AI suggests, sources show, you explain and decide.

How it works

- 1 Read**
Open your PDFs and read as usual.
- 2 Notice**
SELAR suggests a possible link to something you read earlier.
- 3 Compare**
Both source passages appear side by side, so you can check the link yourself.
- 4 Explain & decide**
Say how they connect in your own words, then keep, change or reject the link.

Why we built it this way

From our formative needs survey (38 eligible respondents; 36 answered these items):

31 of 36 wanted a tool that links new reading to earlier reading

28 of 36 were concerned about AI accuracy

24 of 36 were concerned about doing less active thinking

A needs survey, not an evaluation of SELAR.

Grounded in learning research on depth of processing, self-explanation, comparison and retrieval practice.

Register your interest

Scan to open the prototype at **selar-console.vercel.app** or tell any of us you would like to try it. It is an early prototype, so rough edges are expected and honest feedback is the most useful thing you can give.
